The report for this stage must include the following information:

1.	**Team Name**	**Team "BioBox"** The name reflects our core idea: a simple, smart container for biological experiments in space.
2.	**Team Composition and Roles**	• **Alex (Team Leader & Engineer):** Responsible for the mechanical design of the sealed capsule and 3D modeling. • **Maria (Biologist):** Responsible for choosing the biological samples and preparing the experiment conditions. • **Ivan (Electronics Specialist):** Responsible for sensors, temperature control, and the heating system.
3.	**Mission Objective of Your Spacecraft**	**Core Purpose:** To test a low-cost, unified stratospheric capsule that can keep living biological samples safe by maintaining stable internal pressure and Earth-like temperature. **Proposed Experiment:** We plan to launch micro-greens or bacteria samples into the stratosphere. The goal is to check if our smart enclosure can completely shield them from freezing temperatures (down to -70°C) and near-vacuum conditions.
